

Dr.Hung YingKai

Using indirect CAD-CAM composite to restore heavily damaged tooth structure is a good choice. Because this material has very excellent physical property when chewing and function, It's very easy to handle by dentist and dental technician. The most important thing is that it can be easily repaired in the pt's mouth.

With the aid of dental microscope, we can precisely control the range of caries invasion and avoid the non-necessary endo and perio problems. Also we can preserve as much tooth structure as possible. Have nice marginal sealing of restoration material, good contact area and emergency profile, create a harmony relationship between restoration and periodontal tissue and make it be easily cleaned by the patient and the hygienist.

Simple, precise, and effective are three main principles for me to use indirect cad-cam composite and dental microscope to treat my patient.

1. Graduated from National Yang-Ming university(2000~2006)
2. Intern training in Taipei Veteran General Hospital(2006)
3. Service at Jiepin dental clinic(2008~2013) in Taipei County, Taiwan.
