

## The concept of Micro-dentistry

Dental treatment using a microscope is generally interpreted to mean "precise and accurate dental treatment through visual enhancement using an operating microscope," and is also referred to as micro-dentistry.

However, magnification systems (magnification devices) are used in dentistry not only with microscopes but also with loupes and other instruments. In clinical practice, some doctors insist that "everything should be done with a microscope. On the other hand, there are many doctors who say, "A loupe is sufficient. In reality, there are many doctors who say that loupes are sufficient. Since 1998, when I studied under D. Shanelec, a pioneer in periodontal microsurgery, and introduced the microscope to my own practice. Since then, I have been using the microscope in my own practice not only in perio, but also in clinical practice in general, and it has been 25 years this year.. I, In this article, I will discuss my view of micro-dentistry, both micro and loupe, and its clinical applications, using case examples.
