

Microscopic Dentistry for Dental Hygienists

In dental treatment, the key to success lies in having three different professions – dentists, hygienists, and dental lab technicians – work under a magnified view to share a common vision within the team.

Today in Japan, dental hygienists focus on prevention, maintenance, Oral Hygiene Instruction (OHI), and initial periodontal therapy on a daily basis. The use of a microscope by dental hygienists could significantly improve the quality of these tasks.

In this presentation, the speaker wishes to show how a microscope can be effectively used in the work of a dental hygienist.
